## building

### *focus:*

Extra session: finishing rudimentary lift

### *summary:*

we attached the hex shaft thing to the motor and wound the wire around that (it works, yay!) and also added some extra support T slots to the arm system.

### *challenges:*

Not many issues, everything was fairly laid out before, just tying up loose ends (however, screwing things in can get tedious)

### *next steps:*

next steps are adding the beam to the back of the arm to further stabilize, and figuring out what to do with the battery/control hub
